JAMA Journal Club on Depression Screening Guideline

Overview
The American Medical Association (AMA) and JAMA: The Journal of the American Medical Association are working on a pilot of a new form of Continuing Medical Education (CME). The format of CME that is being tested is around the use of social media as a potential educational tool. More and more journal clubs are being conducted on social networks like Twitter, Facebook and others. There are many substantive conversations about journal articles that potentially add additional context and applicability to the content of the article. This pilot seeks to investigate how these social conversations could be structured and moderated to be a resource worthy of awarding AMA PRA Category 1 credit™ for CME.

What Can You Do?
We would like to invite you and anyone in your professional network that would be interested in participating in a lively discussion on Twitter about the latest Depression Screening Guideline published in January 2016 titled: “Screening for Depression in Adults: US Preventative Services Task Force Recommendation Statement”
Your participation in the conversation will contribute to the overall goal of creating a substantive discussion about the article that our pilot learners can follow and learn from.

Your participation can happen at any time during the period of the pilot. This is NOT a live event. We are looking for participants to join the conversation at different times throughout the 3 week pilot period (see below) to ask a question, add a salient point about the applicability of the article content and just add some general new knowledge that is derived from the content of the article.

While the Twitter conversation is happening during the pilot period, AMA and JAMA will be inviting new CME learners to follow the conversation and, if so inclined, join in with comments and questions. They will be awarded CME for their participation.

How, What & Where
